

World Child Cancer
No child should suffer

We believe that every child with cancer, no matter where they are born, should have equal access to the best possible treatment and care.

Over 400,000 children worldwide develop cancer each year. If the disease is detected early enough, many of these children can be cured - 80% of children with cancer in the developed world survive. However, in developing countries, survival rates can be as low as 10%, with many children dying without effective pain relief- 200,000 children die each year without palliative care.

WHERE WE WORK

We support 10 programs across Africa, Asia, and Central America. All of these countries face huge challenges trying to support children with cancer.

WHY WE WORK THERE

Many children with cancer in developing countries remain undiagnosed, or are diagnosed too late to be cured, due to a shortage of trained doctors and nurses in-country.

WHAT WE DO

Simple and cost-effective interventions can be used to break down many of these challenges. World Child Cancer helps to improve access to diagnosis and quality treatment for children with cancer, and support for their families.

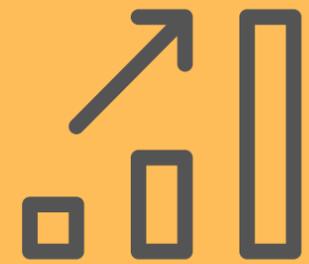

HOW WE DO IT

In each of our partner countries, we work closely with dedicated and skilled professionals who drive the development of quality cancer programs.

OUR IMPACT

Over the past 10 years, World Child Cancer has helped more than 20,000 children with cancer access better treatment. We now have a body of evidence that proves the approach we have been utilising with our partners to address the complex issue of childhood cancer in developing countries is highly effective.

OUR OUTCOMES

World Child Cancer improves survival rates from 10% to 60%

WHAT'S NEXT

By 2023 our ambition is to double our impact, allowing over 10,000 children and their families each year to access improved childhood cancer treatment services.
